

JIMMA CITY ADMINISTRATION

Hands-on User Manual

Step-by-step guide for registration, review, offline work, and notifications

Purpose: Practical reference for implementation, operations, training, and handover of the Jimma City Digital Street Address MIS.

Document: MIS-USER-003

Prepared: 27 August 2026

System: Jimma City Digital Street Address MIS

1. Who should use this manual?

This guide is for Administrators, City Officers, Kebele Officers, Enumerators, and Viewers. Your assigned role determines the pages and actions available after sign-in.

Golden rule: The person who collects a property record should not be the only person who approves it. Use the two-stage review: Kebele verification, then City approval.

2. Sign in

Figure 1. Current Jimma MIS sign-in screen.

Steps

1. Open the Jimma MIS web address.
2. Enter your assigned username.
3. Enter your password.
4. Select **Sign In**.

If you forgot your password

1. Select **Forgot password?**.
2. Enter your username.
3. Open the reset email sent to your registered address.
4. Choose a new password and return to Sign In.

Only authorized Jimma City Administration personnel should use the system.

3. Main navigation

Page	Use it for
Dashboard	View totals, status counts, trends, kebele summaries, and recent property activity.
Properties	Search records, filter by status/kebele/type, open details, and start or review property work.
Map View	Inspect records with GPS coordinates and open the related property.
Reports	Filter and export operational property reports.
Mobile Collection	Enumerator-only field workflow for online capture and offline drafts.
Users	Administrator and City Officer user-management view.
Setup	Maintain kebeles, streets, and blocks when authorized.
Audit Logs	Review traceable system and data actions.

4. Register a property online

1 Open the new property form

Choose **Properties**, then start a new property record.

2 Enter location

Select the kebele, street, block, and house number. These values are used for address management.

3 Enter property and owner details

Enter owner name and phone, property type, ownership type, building name/use, number of floors, occupant/business details, and remarks as applicable.

4 Capture GPS

Select **Capture Current GPS** on a device with location permission, or enter the allowed coordinates. Confirm the point is near the property.

5 Add evidence photos

Upload at least one **Front View** photo. Add side view, business sign, or document photos when useful.

6 Check duplicates and submit

Review any duplicate warning. Save as a draft if information is incomplete, or submit for verification when GPS, required fields, and front photo are ready.

5. Work offline on a mobile device

1. Open **Mobile Collection** as an Enumerator.
2. Complete the field form and capture GPS/photos when the device allows.
3. Select **Save Offline Draft** when the network is unavailable.
4. Open **Drafts** to review or delete a local draft.
5. When connected, synchronize the draft. Confirm it appears as saved to the server.
6. Submit online for Kebele verification once the record is complete.

Offline saving protects field work, but it does not complete approval. A draft must synchronize and then enter the normal review workflow.

6. Review and approval

Status	Meaning	Next action
Draft	Work is saved but not submitted.	Complete required data and submit.
Pending	Submitted and waiting for review.	Kebele Officer checks the record.
Kebele Verified	Kebele-level review is complete.	City Officer performs final decision.
Approved	Final decision accepted; official address code is available.	Use the code in reports and official communication.
Rejected	Reviewer found an issue and entered a reason.	Enumerator corrects the record and resubmits.

7. Owner SMS alerts

When the owner phone is present and SMS integration is configured, the system sends two different alerts:

1. **Kebele verification:** confirms the property was verified and is waiting for final City approval.
2. **City approval:** confirms official approval and includes the generated address code.

For a failed or missing SMS configuration, continue the record workflow, then report the delivery issue to the system Administrator. Never ask an owner to share an API key.

8. Password reset screen

Figure 2. Password reset screen. A real reset link is required before the new-password form is shown.

9. Common problems

Problem	What to check
Cannot sign in	Check username/password, account active status, and whether the API service is available.
GPS is missing	Enable device location permission, move outdoors if appropriate, and retry. Do not submit without required GPS.
Photo will not upload	Use a supported image type and keep it within the system size limit. Confirm network connectivity.
Record is rejected	Read the rejection remark, correct the data, and use Resubmit for Approval.
SMS not received	Confirm owner phone format, SMS provider environment/key, sender configuration, and simulator/provider logs.
Page is blank or stuck loading	Refresh once, check network, then contact the Administrator to check API health and logs.

Controlled reference document. Update this document when the approved workflow, roles, integrations, or deployment configuration changes.
