

JIMMA CITY ADMINISTRATION

Property Registration Workflow

Actor responsibilities, status transitions, address codes, and exceptions

Purpose: Practical reference for implementation, operations, training, and handover of the Jimma City Digital Street Address MIS.

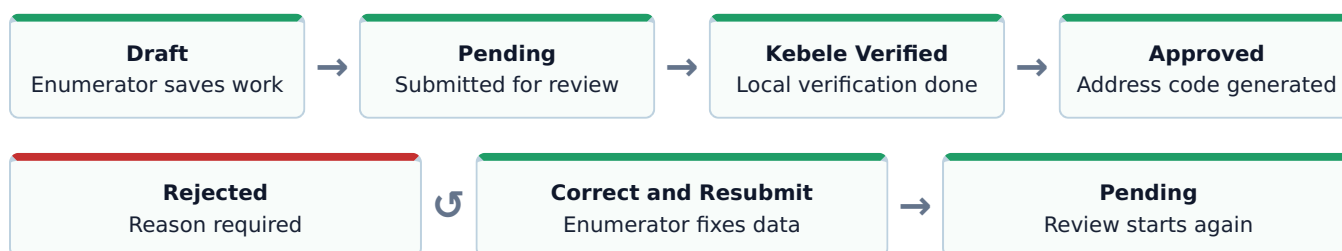

Document: MIS-FLOW-005

Prepared: 27 August 2026

System: Jimma City Digital Street Address MIS

1. End-to-end property workflow

The workflow separates field collection, Kebele verification, and City approval. Each state tells the next person what to do.

2. Workflow by actor

Actor	Inputs	Action	Output / handoff
Enumerator	Owner information, property details, location, GPS, photos	Create a property, check duplicates, save online/offline, and submit for verification.	Pending property with evidence.
Kebele Officer	Pending property, map point, photos, and field details	Review accuracy. Select Verify or Reject; rejection requires a useful remark.	Kebele Verified property or Rejected property.
City Officer	Kebele Verified property and review history	Perform final quality and policy check. Select Approve or Reject.	Approved property with official address code or Rejected property.
System	Approval decision and property address values	Persist approval history, generate code at final approval, write audit data, and attempt SMS notification.	Traceable record and owner notification event.
Administrator	Operational configuration and user register	Maintain users, locations, service configuration, backups, and exception handling.	Healthy and governed service.

3. Decision rules

1. A property should not be submitted until required location data and a front-view photo are present.
2. A Kebele Officer verifies local facts and evidence; verification is not final approval.
3. A City Officer performs the final approval decision and triggers official address code generation.
4. A rejection must include a reason that the Enumerator can act on.
5. A rejected record is corrected and resubmitted; the review history remains available.
6. An owner SMS is attempted only when the owner phone exists and the SMS service is configured.
7. Notification failure must not erase the property or approval decision; it is an operational exception to resolve.

4. Owner notification messages

Message 1 — Kebele verification

Confirms that the property has been verified by the Kebele Officer and is awaiting final City Office approval.

Trigger: status changes to `kebele_verified`.

Message 2 — City approval

Confirms official approval and includes the generated address code for the owner's records.

Trigger: status changes to `approved`.

5. Address code generation

At final approval, the system composes the official code from Kebele, street, block, and house number values:

JIM-KB{KebeleCode}-ST{StreetCode}-BL{BlockCode}-HN{HouseNumber}

Component	Source	Example
Prefix	System standard	JIM
Kebele	Selected property kebele/code	KB01
Street	Selected street/code	ABAJIF
Block	Selected or entered block code	BL01
House	House number	HN101

6. Exception handling

Exception	Immediate action	Owner
Missing GPS	Return to Enumerator for field correction; do not approve incomplete location data.	Enumerator / Kebele Officer
Missing front photo	Request evidence upload before submission or approval.	Enumerator / reviewer
Duplicate warning	Compare existing record and confirm whether this is an update or a new property.	Enumerator / reviewer
Wrong address hierarchy	Correct kebele/street/block setup or return the property for correction.	Administrator / City Officer
SMS delivery failure	Keep the approved property; check phone format, provider mode, sender, key, and service logs.	Administrator
Offline draft not syncing	Reconnect, open Drafts, retry sync, and preserve the local draft until server confirmation.	Enumerator / Administrator

Controlled reference document. Update this document when the approved workflow, roles, integrations, or deployment configuration changes.
